FOUNDER'S OPERATING MANUAL

CommunityConnect

Find your event. Bring your people.

Everything the platform does today, how each part works, and how to run it: the live founder console, the referral program, team access codes, the event playbook, the numbers that matter, and what is honestly still on the roadmap.

Version 0.3.0 · October 2026 · Applies to the live deployment

OVERVIEW

What you are running

CommunityConnect turns scattered event links into one confirmed group plan. Groups shortlist events, see clashes, vote in a Decision Room, and confirm a single plan - then meet people there through opt-in introductions. The product earns trust by being checkable: every listing carries its source, every recommendation shows its formula, and attendance is never overstated.

The core loop

- Discover or post events (with source links)
- Shortlist candidates inside a private Circle
- Vote can / maybe / cannot before a hard deadline
- Finalize one plan; everyone confirms separately
- Find a buddy, attend, vouch, repeat

What it deliberately is not

- Not a ticketing platform. A confirmed plan is not a ticket; registration always happens on the organizer's own site.
- Not a feed to scroll. XP is capped daily and the dashboard points at actions, not content.
- Not a verified-credentials network. College and company claims are peer-vouched, never badged as official.
- Not anonymous. Real names, consent-based contact, private-by-default circles and votes.

The one metric that matters

Weekly confirmed group plans - a plan counts once, when two or more people independently confirm it. Everything else (signups, votes, vouches) is supporting telemetry for this number.

PRODUCT REFERENCE

How the features work · I

Accounts, profiles and privacy

- Signup captures name, email, password (salted and hashed), optional college and company, and conduct acceptance.
- Privacy toggles - show college / company / background / intents, directory opt-in - apply instantly everywhere, including the printed networking card.
- Account export produces a JSON file of everything the user owns. Deletion pseudonymizes authored content and removes participation.
- Team access codes at signup can claim the founder seat (single, immutable) or a co-founder seat (maximum two). See the runbook for the codes.

Events and discovery

- Manual posting with a source URL is the reliable path; listings show the provider, price (or 'unknown' - never assumed free) and accessibility if supplied.
- Discovery supports search, city, format, price and tag filters. Circle-only events never appear in public search or previews.
- Attendees are shown per person: 'planning', self-reported 'registered', or plan-confirmed. Opening a source link never registers anyone.
- Material edits (time, title, cancellation) mark dependent plans 'review needed' and notify every participant and RSVP.
- Every event page exports a standards-correct .ics calendar file.

Circles and Decision Rooms

- Circles are private planning rooms with an owner, revocable invite codes, an activity feed, and circle-only events.
- A Decision Room snapshots the voter roster, sets a hard deadline, and accepts ballots: can / maybe / cannot per candidate, plus one favorite. Blank is 'no response', never 'cannot'.
- Score = 100 x (0.65 x can + 0.15 x maybe + 0.20 x favorite) / roster. Quorum is 60% of the roster (minimum 2). Ties stay ties; zero preference recommends nothing; overrides require a written reason shown to the circle.
- Finalizing creates one plan 'awaiting confirmations'. A plan becomes confirmed only when two or more eligible participants independently confirm. Votes are never shown to anyone before the deadline; individual ballots are never visible to anyone, including circle owners.

PRODUCT REFERENCE

How the features work · II

Peer vouches (trust)

- After an event starts, participants who share that event can vouch for each other: a heart, claim verification (college / company / course - 'I saw the evidence'), and conduct signals (polite, professional).
- Vouches count for a rolling 14-day window, then fade. One vouch per pair per window. Self-vouches and blocked pairs are rejected.
- Public surfaces show only positive signals with counts. Concerns go through the report flow to moderators; vouch notes are moderator-only.
- Vouching awards no XP on purpose - reputation must not be farmable.

Referrals and Founding Members

- Every account has an invite code and link. A standard join gives both sides +75 XP; the referrer gets a 14-day directory boost, the newcomer a 7-day welcome boost, both get the Connector badge.
- Joins through founder-team links create Founding Members: +100 XP, every accent theme unlocked from day one, permanent top placement in the People directory, and the Founding Member badge. This is the privilege that motivates people to join through your links specifically.
- The invite leaderboard in the founder console shows exactly who brought whom - use it to recognize your best promoters at events.

Networking card, support hub, momentum

- The networking card is a printable 85.6 x 54 mm card with the user's QR profile link plus a vCard QR for phones. It always respects privacy toggles.
- The support hub aggregates intent chips: open to work, seeking referrals, hiring, between roles. The buddy board lets anyone ask for company at an event; both sides must accept.
- Momentum is a gentle streak (one check-in per day, weekly grace day), contribution XP with a 30-per-day cap, and cosmetic unlocks. Safety and privacy tools are always free.

Moderation and the founder console

- Anyone can report events or accounts. Moderators resolve with a mandatory note; the author is notified, the reporter stays confidential. Mass reports never auto-ban.
- Roles: founder (one, immutable), co-founder (max two), moderator, member. The founder console - visible only to the founder team - edits any account, grants roles, suspends accounts, and shows the live dashboard, invite leaderboard, pulse feed and audit log.
- Every administrative action is appended to the audit log with actor, action, target and time.

OPERATIONS

Founder runbook

Team access codes

Purpose	Code	Effect at signup
Founder (you)	**CC-FOUNDER-2026**	Claims the single founder seat, full control
Co-founder	**CC-CREW-2026**	Claims one of two co-founder seats
Everyone else	**your invite link**	Member + Founding perks on team links

Treat these codes as launch-phase conveniences: they work because accounts live per browser in this version. Give the founder code to nobody; give the co-founder code only to your two named co-founders. When the server backend lands, these are replaced by real invitations, and the audit log keeps its history.

The event playbook (you + one teammate)

- Before: pick events with 50-200 expected attendees. Print the flyer PDF and 20 QR networking cards. Both carry your founder invite QR - every scan is attributable.
- 60-second demo: open the Decision Room on your phone, show three candidates, vote, finalize, confirm. Then show your networking card QR and the invite leaderboard.
- The ask: 'Create a free account with this QR, and invite two friends - you both get bonus XP, and people who join through us get Founding Member perks.'
- At the venue: never post without organizer permission, never scrape attendee lists, never spam DMs. Ask the organizer to co-host a Decision Room for their next event; offer them moderator tools later.
- Same evening: check the founder console pulse feed, welcome every new member by name, and accept pending connection requests. This is what turns a scan into a retained user.
- Weekly: review the invite leaderboard, thank your top three promoters publicly, and post two or three fresh, source-linked events for your city.

OPERATIONS

Numbers and honest limits

What to watch weekly

North-star	Weekly confirmed group plans (counted once per plan)
Growth	Invite leaderboard: invites sent x accepted; Founding Members count
Activation	Signup -> first circle -> first vote -> first confirmed plan
Trust	Vouches per event; hearts; conduct signals (rolling 14 days)
Safety	Open reports and time-to-resolution; unwanted-contact reports
Retention	Week-2 return rate; repeat planning at 4 weeks

Honest limits of this version

- Accounts and data live per browser. Cross-device sync, server-side auth and email arrive with the Supabase swap - the schema mapping and swap point are documented in docs/DECISIONS.md.
- Team access codes and moderation run in the client; enforcement hardens server-side in the next milestone.
- 'CommunityConnect' is a working name - trademark and domain clearance are still pending (see docs/BRAND.md for the shortlist).
- Demo data on first load is fictional and labeled; never present it as real traction.

Bringing in teammates

- Add them to the GitHub repository with write access; they branch from main and open pull requests - CONTRIBUTING.md defines the bar.
- The architecture doc (docs/ARCHITECTURE.md) explains the monorepo in one read: pure domain logic in packages/core, the web app in apps/web, tests pinned to rules.
- CI runs typecheck, tests and build on every pull request once the workflow scope is enabled (one command, documented in PROJECT_STATUS.md).
